MCDOT

CADD

Standards

FOR MICROSTATION V8i

January 2010

Maricopa County
Department of Transportation
2901 W. Durango Street
Phoenix, Arizona 85009

PART I
SUBMITTAL GUIDELINES

1.1 <u>MCDOT CADD STANDARDS</u>

<u>Originator: Engineering Division</u>

INTRODUCTION

The Maricopa County Department of Transportation (MCDOT) Drafting Guidelines for MicroStation V8i sets forth requirements and regulates all CADD production by MCDOT personnel, consultants, and contractors.

MicroStation® and InRoads® are registered trademarks of Bentley Systems, Inc. or Bentley Software, Inc.

PURPOSE

The purpose of this document is to define the rules and regulations, and guidelines for visually communicating a project design.

APPLICABILITY

These standards shall apply to electronic drafting files associated with construction and reconstruction plans of transportation facilities.

AUTOCAD

AutoCAD DWG or AutoCAD DXF is not an acceptable file format at this time.

1.2   <u>SUBMITTALS</u>

<u>Originator: Engineering Division</u>

For most projects, there are two types of submittals required with a submittal. The first is a hard copy submittal and the second is an electronic file submittal. For specific submittal requirements, refer to the project scope of work.

ELECTRONIC SUBMITTALS

Electronic submittals consist of an "electronic project" on approved media. Refer to the "electronic project" section of this manual and the project scope of work for specific requirements.

<u>Submittal Media</u>
External hard drive with USB interface connection
Compact Disc (CD)
Digital Versatile Disc (DVD)

<u>NOTES</u>
Submitted media will not be returned.
Other media may be delivered as approved by MCDOT

1.3 ELECTRONIC PROJECTS

Originator: Engineering Division

Digital information associated with a project from conceptual design to as-built plans will be stored in an electronic project. The directory structure of an electronic project will be used to store the CADD graphics files, survey, and engineering data files. Digital terrain models, project transmittals, letters, memos and spreadsheets are also stored in an electronic project. The directory will be archived in its entirety to preserve the complete project.

ELECTRONIC PROJECT COMPONENTS

At the highest level, an electronic project consists of four main directories and their files below a project directory (the picture below shows the directory structure of an electronic project).

Figure 1 electronic project Directory Structure
DIRECTORIES & FILES

Electronic project directories group together a general type of project file. The table below lists the directory name and a description of the type of file that the directory contains.

Table 1 Electronic Project Directory Names

Directory Name	Directory Content / General File Type Description
data	Any file that is not directly used with the design graphics, i.e. correspondence, transmittals, email messages, reports, etc.
designsupport (Design Support)	Files that are used in coordination with design graphics files such as InRoads files, or MicroStation resource files
dgn (Design Graphics)	Any MicroStation DGN file that is used in plan set production
plot	A PDF file for each sheet in a set of plans or files used to configure a printer/plotter

DIRECTORY RESTRICTIONS

Each of the main directories in an electronic project has certain rules that must be followed in order to meet the minimum requirements. There are four directory restrictions in an electronic project.

Table 2 Directory Restrictions

Name	Description
File Type Restriction	The file type restriction limits the types of files allowed in the directory. All directories have a general file type restriction based on the name of the directory.
File Name Restriction	The file name restriction constrains the name of the file to the MCDOT file naming convention.
Subdirectory Restriction	The subdirectory restriction limits whether or not subdirectories may be created in the directory. All subdirectories inherit the restrictions of their parent directory. Subdirectory names must describe the content that is contained within them.
File Content Restriction	The File Content restriction limits the type of content within the file.

PART II
ELECTRONIC PROJECT CONTENT GUIDELINES

1.4 DIRECTORY CONTENT GUIDELINES

Originator: Engineering Division

OVERVIEW

The content guideline sets forth rules and restrictions that apply to the content in an electronic project. The guideline is divided into two parts, the first part discusses the directory content and the second part describes file content.

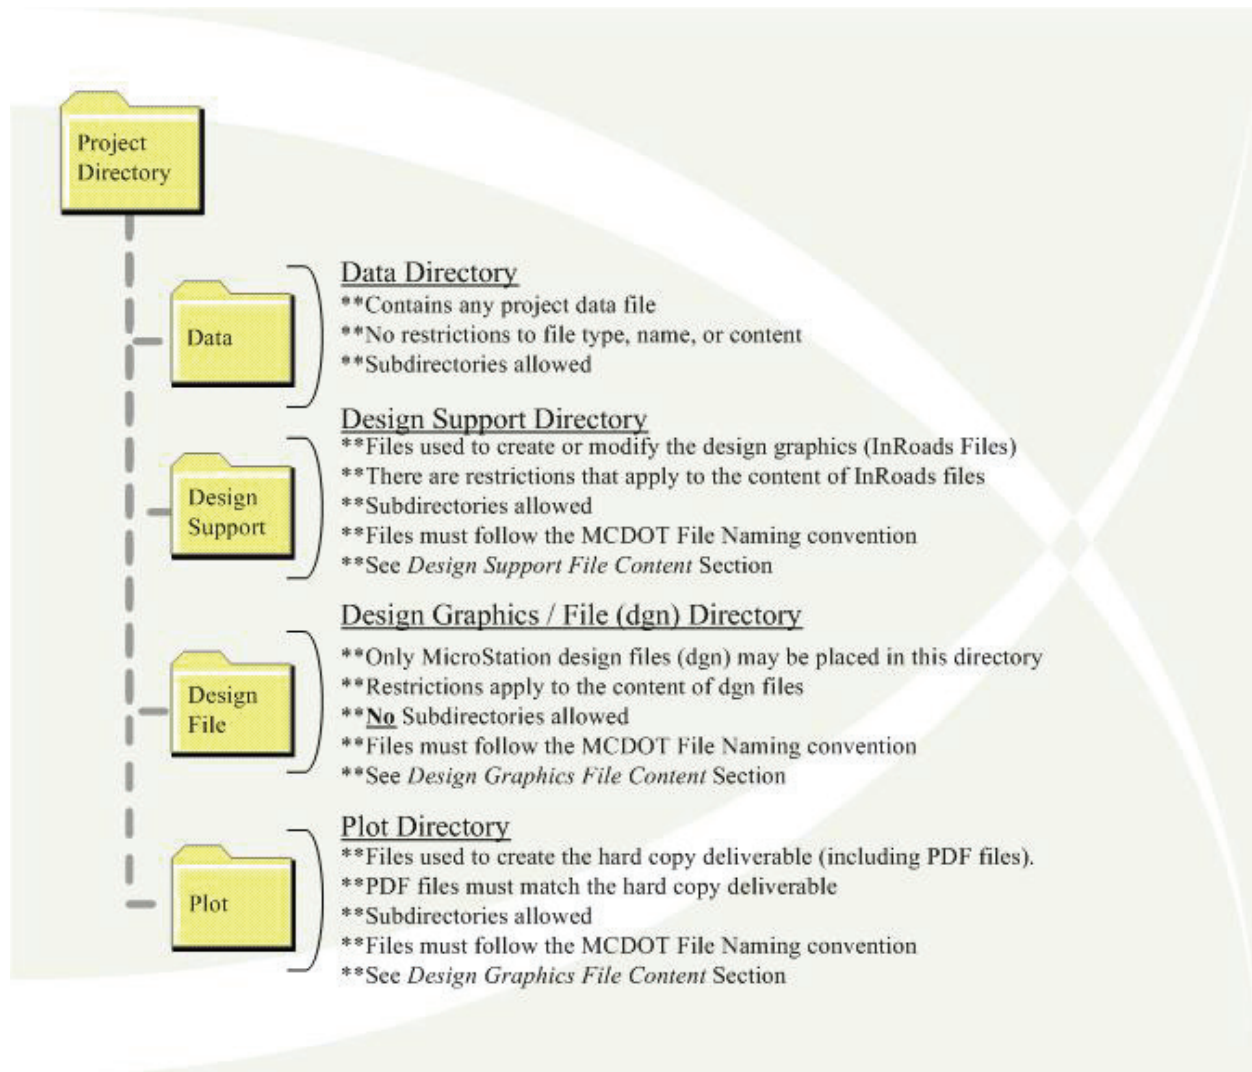

Figure 2 Electronic Project Content

ELECTRONIC PROJECT DIRECTORIES

Electronic project directories are used to group project files. Initally, there are five directories in an electronic project. The user has the ability to create unlimited subdirectories in three of the five main project directories.

PROJECT DIRECTORY

The top-level directory of an electronic project is the work order number assigned to the project by MCDOT.

PROJECT DIRECTORY RESTRICTIONS

Table 3 Project Directory Restrictions

Name	Constraints	Description
File Type	N/A	No Files shall be placed in the project directory.
File Name	N/A	No Files shall be placed in the project directory.
Subdirectory	Yes	No Subdirectories, other than the four main directories, shall be created in the project directory.
File Content	N/A	No Files shall be placed in the project directory.

DATA DIRECTORY (DATA)

The data directory contains project data not specifically associated with the design file graphics (i.e. correspondence, memos, transmittals, reports, etc.).

DIRECTORY RESTRICTIONS

Table 4 Data Directory Restrictions

Restriction Name	Constraints	Description
File Type	No 1	Any file may be placed in the data directory.
File Name	No	The MCDOT File Naming convention is recommended but not required on files in the data directory.
Subdirectory	No	Any subdirectory may be created below the data directory
File Content	No 2	There are no restrictions on the content within a file in the data directory

---

[1] MicroStation DGN files may be placed in the data directory only if they are used for exhibits or report figures and are not attached as a reference file to a file in the dgn directory.
[2] Refer to the Project Scope of Work for additional File Content restrictions that may apply.

DESIGN SUPPORT DIRECTORY (DESIGNSUPPORT)

The Design Support directory includes all files used to support the design file graphics. Examples of design support files include all existing and proposed digital terrain models, geometry alignments, ASCII survey files, etc.

DIRECTORY RESTRICTIONS

Table 5 Design Support Directory Restrictions

Restriction Name	Enforced	Description
File Type	Yes	The type of file must be used in the creation and/or modification of the design file graphics, (InRoads, Conspan, Leap, etc.).
File Name	Yes	The MCDOT file naming convention is required.
Subdirectory	No	Subdirectories are permitted.
File Content	Yes	Most design support files have a restriction, see the Design Support File Content section.

COMMON DESIGN SUPPORT FILE TYPES
The table below lists some of the common design support files.

Table 6 Common Design Support File Types

INROADS FILES		
Name	**File Ext**	**Purpose**
Alignment	alg	Stores project horizontal and vertical alignment geometry data.
Surface	dtm	Stores existing and proposed 3D features data
Template Library	itl	Stores project typical section templates
Roadway Design	ird	Defines corridors and decision logic for a roadway using the project alignments and templates.
XML Report	xml	An InRoads generated XML report file
InRoads Drainage	sdb	Stores project drainage information
Survey Field Book	fwd	An InRoads Survey field book file
Preference File	xin	An InRoads preference file

Table 7 Common Design Support Resource File Types

COMMON DESIGN SUPPORT RESOURCE FILE TYPES		
Name	**File Ext**	**Purpose**
User Configuration File	ucf	A MicroStation Configuration File
Project Configuration File	pcf	A MicroStation Configuration File
Design File Library	dgnlib	A MicroStation Resource file
Symbol Resource	rsc	A MicroStation Resource file
MicroStation Cell Library	cel	A MicroStation Resource file
MicroStation Color Table	tbl	A MicroStation Resource file

DESIGN FILE DIRECTORY (DGN)

The design file directory is where all MicroStation DGN files are stored. It provides a single location for all project DGN files with the intent that no reference files will have broken paths if they are all located in the same directory.

DESIGN FILE DIRECTORY RESTRICTIONS

Table 8 Design File Directory Restrictions

Restriction Name	Applied	Description
File Type	Yes	Only DGN files shall be placed in the design file directory.
File Name	Yes	The MCDOT file naming convention is required.
Subdirectory	Yes	No Subdirectories shall be created in the design file (dgn) directory.
File Content	Yes	Content restrictions apply to all design files.

PLOT DIRECTORY (PLOT)

The plot directory contains PDF files created using the MCDOT PDF plot configuration file (see Plotting section).

PLOT DIRECTORY RESTRICTIONS

Table 9 Plot Directory Restrictions

| Restriction Name	Applied	Description
File Type	Yes	Only PDF files and configuration files used to create them shall be placed in this directory
File Name	Yes	The MCDOT file naming convention is required.
Subdirectory	No	Any subdirectory may be created below the design support directory provided it is named correctly.
File Content	Yes	Content in a PDF plot must exactly match the hard copy delivered.

Table 10 Common Plot File Types

Name	File Ext.	Purpose
Adobe Acrobat	pdf	An electronic copy of the submitted hard copy plan set.
MicroStation Plot Config	pltcfg	File containing specified properties of your printed output
MicroStation Pen Table	tbl	ASCII text files that contain instructions for resymbolizing the printed output of design files

# 1.5 FILE NAMING CONVENTION

Originator: Engineering Division

MCDOT file names shall include the project work-order number followed by a file category designation and a file description. Optionally, an MCDOT file name might include a sequential file number.

00000_BB_FileDescription[+01].EXT

- Work order number
- File category
- File description
- File number [optional]
- File extension
FILE NAMING COMPONENTS

◊ WORK-ORDER NUMBER

◊ FILE CATEGORY

◊ FILE DESCRIPTION

◊ FILE NUMBER (OPTIONAL)

◊ FILE EXTENSION

WORK-ORDER NUMBER

00000_BB_FileDescription[+01].EXT
- Work order number

The first section of the file name shall be the work order number assigned to the project by MCDOT. It is a unique alphanumeric identifier for the project (i.e. TT123). An underscore character follows the work order number.

FILE CATEGORY

00000_BB_FileDescription[+01].EXT

File category

The file category is based on the file type and/or the design file category.

Table 11 File Naming Convention Categories

| Base Files	
BB	Structures
BC	Survey Control Points
BD	Road Design
BE	(Existing) Topographic Survey
BH	Drainage
BN	Sheet Index
BP	Profile
BR	ROW
BS	Design Surface
BT	Traffic
BU	Utilities
BX	Cross Sections
Sheet Files	
SS	Standard Sheets
SD	Detail Sheets
SC	Construction/Design Sheets
ST	Traffic Sheets
Design Support / General	
DS	Design Support
GN	General (not related to design graphics)

FILE DESCRIPTION

00000_BB_FileDescription[+01].EXT
File description

A description of what is included in the file. The description shall not be longer than 63 characters. The description shall be set by the user and shall provide enough information to adequately describe the contents of the file to someone unfamiliar with the project.

FILE NUMBER

00000_BB_FileDescription[+01].EXT

File number [optional]
The file number is a sequential number associated with the particular file. The brackets "[","]" shall not be included in the file name i.e. 00000_SS_QuantitySummary+01.dgn, 00000_SS_QuantitySummary+02.dgn

FILE EXTENSION

00000_BB_FileDescription[+01].EXT

File extension

A standard Windows file extension. The user shall use the default file extension for the program unless approved by MCDOT.

1.6 ELECTRONIC PROJECT FILE CONTENT

Originator: Engineering Division

There are four types of files associated with an electronic project: data, design support, design file (dgn) and plot. A description of each is located at the beginning of this section.

DESIGN SUPPORT FILES

Design Support files create or modify the design graphics. They can be InRoads files or MicroStation resource files that modify the look of the design graphics. This section deals only with symbology and feature names inside InRoads files.

INROADS GEOMETRY NAMING

The InRoads alignment (ALG) file contains the geometric data for a design project. InRoads requires the creation of a geometry project. The name of the geometry project shall be given the same name as the ALG file name (i.e. if an ALG file is named TT123_DS_FirstStreet.alg, the geometry project within this ALG file should be named TT123_DS_FirstStreet).

Horizontal alignments within the geometry project shall be named using a two-letter identifier, the road name or clarifying description, and a numeric designation.

XX-Description_##

For instance, the first centerline alignment for First Street would be called CL-FirstStreet_01. The approved two-letter identifiers are shown in the table on the following page.

Vertical alignments and superelevation designs shall be named the same as their parent horizontal alignment with a numeric designation added to the end.

XX-Description_##_##

Continuing the previous example, the first vertical alignment for the First Street centerline would be called CL-FirstStreet_01_01.

The InRoads description for any horizontal alignment, vertical alignment, or superelevation must include the date of creation. It is also recommended the designer's initials be included in the description as well as the station location or any additional information that is easily understood by any future designer or reviewer.

Table 12 InRoads Geometry Naming Identifier

Identifier	Description
CL	Roadway Centerline Alignment
CC	Culvert Centerline Alignment
CH	Channel Centerline Alignment
DW	Driveway Centerline Alignment
EP	Proposed Edge of Pavement
EX	Existing Edge of Pavement
FL	Proposed Ditch Flow Line
PL	Property Line
RW	Right of Way Line
SC	Saw Cut Line
SL	Section Line

INROADS TEMPLATE LIBRARY

The MCDOT InRoads template library file, available to download on the website, shall be used.. Users may create new templates particular to their project but shall not modify the existing templates

TEMPLATE POINT NAMES

Point names are provided in the typical section library. The user shall use only point names found in the typical section library. Point names in the template library are built from a combination two-character sub-point names. The table on the next page contains the sub-point names.

The typical sections are divided into three zones. Zone 1 includes any points used in creating the roadway pavement. Zone 2 contains points used to construct the roadway shoulders. Zone 3 contains all other points used for creating the end conditions.

Any point name not already designated as right or left shall add a left or right designation to the name. For instance, a right roadway shoulder point name would be SH_Rt and a left shoulder point name would be SH_Lt.

If more than one of a particular point type is given within a zone, a numeric qualifier should be added to the point name before the left or right designation.

TEMPLATE SUB-POINT NAMES

Point names in the template library are built from a combination of these 2 characters sub-point names.

01	Slope 1:1
02	Slope 2:1
03	Slope 3:1
04	Slope 4:1
06	Slope 6:1
10	Slope 10:1
20	Slope 20:1
AB	Aggregate Base Course
AC	Asphalt Cement
AR	Asphalt Rubber
BB	Back Bottom (Curb)
BN	Bench
BT	Back Top (Curb)
CB	Curb
CL	Centerline
CT	Cut
DB	Ditch Bottom
EP	Edge of Pavement
FC	Face (Curb)
FI	Fill
GB	Gutter Bottom (Curb)
GT	Gutter Top (Curb)
IB	Inside Bottom
IN	Inside
IT	Inside Top
LB	Lip Bottom (Curb)
LT	Lip Top (Curb)
MD	Median
OT	Outside
RK	Slope (Rock) 1.5:1
SC	Sawcut
SG	Subgrade
SH	Shoulder
SP	Slope (Special) 1.5%
SW	Sidewalk
TE	Thickened Edge
VS	V-Swale

INROADS CORRIDOR NAMING

The InRoads roadway library file shall have the same base name as the geometry project file with the appropriate .ird extension attached.

1.7   DESIGN FILE CONTENT

Originator: Engineering Division

BASE REFERENCE FILES

The concept of reference files is important because a design change made to the reference file is reflected on each of the sheet files. Base reference files contain graphical data that is created during the design of a project. MCDOT base files are always created on a one-to-one scale. Each base file contains elements of a certain type. For example, a utility base reference file contains data such as telephone lines. When deciding what belongs in a base file versus what belongs in a sheet file it is helpful to think of the base file as "what is existing" or "what will be built" and a sheet file as "instructions on how to build it". The table below lists all base files.

Base File	Abbr.*	Purpose
Structures	BB	Proposed Structures (bridges, box culverts, etc)
Project Control	BC	Existing Survey Control Points
Road Design	BD	Proposed Roadway Design and Earthwork
Existing Topo	BE	Existing Topographic Survey (all existing surveyed items)
Drainage/Pipes	BH	Proposed drainage including irrigation, and storm drain pipes
Sheet Index	BN	Plan set sheet index
Profile	BP	Alignment Profiles
ROW	BR	Existing & Proposed ROW
Design Surface	BS	Proposed DTM Features
Traffic	BT	Proposed Traffic Control Items
Utilities	BU	All existing and proposed utilities
Cross Sections	BX	Alignment Cross Sections

* For MCDOT File Naming Convention

SHEET FILES

Sheet files are the eventual products of a CADD-produced design. A sheet file represents the assembly of several of the base reference files to present the data required for a plan sheet. Each binary sheet file has a one-to-one correlation with a physical plan sheet. To produce the plan set, reference base files are created, then sheet files. Annotation and symbols placed in sheet files must be placed at a set scale corresponding to the desired plot scale.

BASE FILE RESTRICTIONS

There are a few content guidelines that apply to all base reference files.
- ◊   Base files shall not be broken into multiple files or models.
- ◊   All base files shall be drawn at 1:1 scale in a design model.
- ◊   Base files shall not include plan details or annotation that will appear in the plans.
- ◊   All linestyles shall be drawn with a 1.0 scale factor.

BASE FILE LEVELS

Each base file contains a core group of levels that a user can add to when needed.   The table below lists the core level names in each base file.

Table 13 Base File Core Levels

STRUCTURES (BB)	EXIST TOPO (BE)	DESIGN SURFACE (BS)
ANNOTATION	ANNOTATION	ANNOTATION
BOXCULVERT	BARRIERS	CONTOUR
BRIDGE	BLUE STAKE	CORRIDOR
WALL BARRIER	BRIDGES	POINT

	BOUNDARY	**PROFILE (BP)**
	COGO	ANNOTATION
	EASEMENT	DESIGN
	POINT	EXISTING
	PROPERTY	GRID
	ROW	POINT

BASE FILE LEVEL NAMING GUIDELINES

These guidelines apply to the naming of new levels created in a base file.
◊ The name of the new level must start with the name of a core level in the base file.
◊ Separate the core level from the new level by using a plus (+) sign. "Bd_Road+EdgeUnpaved" is an example of appending EdgeUnpaved to the core level "Bd_Road".
◊ Do not create levels with duplicate purposes, within the same base file. If the level "Bd_Road+EdgeUnpaved" exists don't create a level named "Bd_Road+EdgeDirt"
◊ Place all nouns before adjectives when naming new levels. Put "Edge" (noun) before "Unpaved" (adjective) when creating the Bd_Road+EdgeUnpaved level.
◊ Do NOT use catchall words such as miscellaneous (misc), general or other non-descriptive words when creating new level names. All parts of the level name shall add to the meaning.
◊ Do NOT change the level names in the level libraries.

BASE FILE LEVEL SYMBOLOGY GUIDELINES

The user shall assign the level symbology based on a common sense approach, using the following guidelines:
◊ Only use linestyles from one of the MCDOT linestyle libraries.
◊ Colors above 100 shall only be used for grayscale items.
◊ Symbology shall be assigned to the level whenever possible and elements shall be created with "ByLevel" symbology.

STRUCTURES BASE FILE (BB)

The Base Structures file contains all structure designs. The levels shown in the table below are regularly updated and may not exactly match the downloaded DGNLIB.

MARICOPA COUNTY DEPARTMENT OF TRANSPORTATION DRAFTING GUIDELINES

1.8 <u>DRAFTING GUIDELINES</u>

<u>Originator: Engineering Division</u>

PLAN SET SHEET LAYOUT

The sheets shall appear in this order if they are included in a plan set.

Face Sheet
General Notes
Quantity Summary Sheets
Typical Sections
Geometric Control
Paving Plan and Profile Sheets
Intersection Detail Sheets
Driveway Profiles
Paving Details
Strom Drain Plan and Profile Sheets
Connector Pipe Profiles
Culvert Profile Sheets
Drainage Detail Sheets
Irrigation Sheets
Bridge Sheets
Mass Diagram Sheet
Landscape Sheets
Traffic Signal Sheets
Signal Interconnect Sheet
Striping Sheets
Traffic Control (Detour) Sheets

DRAFTING WORKSPACE

SEED FILES

Seed design files are template files that contain the appropriate default settings and attributes. A new design file is actually a copy of the seed file. Seed files do not contain elements, but they do contain settings and view configurations. Having a seed file with customized settings keeps the user from having to adjust settings each time a new design file is created.

There are four Standard seed files for use on MCDOT projects. There is a two-dimensional and three-dimensional version of both the MCDOT Bridge seed file (seed2dB.dgn, seed3dB.dgn) and the MCDOT civil seed file (seed2d.dgn, seed3d.dgn). The civil seed files represent those files, which require the use of a plan section of the design in the true coordinate plane. The bridge seed files will be for structural details that require a higher degree of accuracy than the civil but may not need a true coordinate plane on which to work. New files created over the course of a project will utilize these seed files. Seed files are located in: ..\designsupport\Standards\seed\.

DESIGN FILE LIBRARIES

A Design File Library is a DGN file that contains data resources, such as cells, levels, and styles, that are shared throughout files and among users.
All MicroStation elements have attributes that control their appearance. Creating a consistent look for all construction plans produced by MCDOT requires that the elements attributes are set properly. Using the MCDOT Design File Libraries help ensure consistency.

CELL LIBRARIES

The table below lists the cell libraries.

Bridge Cells	DS_2009bridge_e.cel
Bridge Detail Cells	DS_2009bridgedetails_e.cel
Roadway Design Cells	DS_2009design_e.cel
General Cells	DS_2009general_e.cel
Striping Cells	DS_2009Striping.cel
Striping Symbol Cells	DS_2009StripingSymbols.cel
Survey Cells	DS_2009survey_e.cel
Text Symbols	DS_2009TextSymbols.cel

LEVEL LIBRARIES

Each of the base reference files described in the content guideline is also a design file library (dgnlib). There are also five sheet level libraries. The table below contains all of the dgnlib level libraries that MCDOT uses.

Level Library Name	File Name
Structures Base File Levels	BB_BaseStructures.dgnlib
Project Control Base File Levels	BC_BaseProjectControl.dgnlib
Roadway Design Base File Levels	BD_BaseRoadDesign.dgnlib
Existing Topo Base File Levels	BE_BaseExistingTopo.dgnlib
Drainage Base File Levels	BH_BaseDrainage.dgnlib
Design Profile Base File Levels	BP_BaseDesignProfile.dgnlib
ROW Base File Levels	BR_BaseRow.dgnlib
Design Surface Base File Levels	BS_BaseDesignSurface.dgnlib
Traffic Base File Levels	BT_BaseTraffic.dgnlib
Utility Base File Levels	BU_BaseUtilities.dgnlib
Cross Sections Base File Levels	BX_BaseCrossSections.dgnlib
Construction Sheet Levels	SC_ConstructionSheets.dgnlib
Detail Sheet Levels	SD_DetailSheets.dgnlib
Traffic Sheet Levels	ST_TrafficSheets.dgnlib
Sheet Annotation Levels	S_SheetAnnotation.dgnlib
Sheet Borders Levels	S_SheetBorder.dgnlib

TEXT STYLES LIBRARY

MCDOT now uses the Arial and Garamond true type fonts for all CADD files. This was done to improve print quality as well as ensure future compatibility. Most symbols used in the previous versions of the standard are available in the MicroStation V8i word processor.

Font Use	Font
Sheet Text	Arial Italics
Title Text	Arial
County Text	Garamond

Sheet Text Parameters

LINESTYLE LIBRARIES

The table below lists the MCDOT Linestyle resource libraries.

ADOT Linestyles	DS_ADOT_e.rsc
General Linestyles	DS_GeneralLinestyles.rsc
Utility Linestyles	DS_MCDOTUtilityLinestyles.rsc
Traffic Linestyles	DS_TrafficLinestyles.rsc
Utility Multi-line Styles	DS_MCDOTUtilityMulti-lineStyles.rsc

ADOT LINESTYLES

To provide for more consistency throughout the State of Arizona, MCDOT has adopted several of the Arizona Department of Transportation's V8 linestyles into the DS_ADOT_e.rsc linestyle library. The DS_ADOT_e.rsc library contains only ADOT linestyle definitions from the linestyle resource library (adot_e.rsc). The ADOT linestyle definitions were not modified to create the DS_ADOT_e.rsc library.
The User shall only use a linestyle from one of the MCDOT linestyle libraries.

MULTILINE STYLES

Multi-line styles are useful for pipelines that are 18" or greater in diameter that must be printed at scales other than 1" = 100'. There is a multi-line style library for pipes that are to be plotted at 10, 20, 30, 40, 50, 60 scales.

PLOTTING

The MCDOT workspace includes three plot configuration files (pltcfg). The files have a pltcfg extension and take advantage of the new XML-based plot configuration format released with the V8i version.

MCDOT XM CAD GUIDELINES (MXM)
Default Lineweights using MXM bw printer.pltcfg

Graphic Definition	Weight	Thickness (mm)	Thickness (inch)
	0	0.18	0.007
	1	0.25	0.010
	2	0.35	0.014
	3	0.50	0.020
	4	0.70	0.028
	5	1.00	0.040
	6	1.20	0.047
	7	1.40	0.055
	8	1.60	0.063
	9	1.80	0.071
	10	2.00	0.079

GRAYSCALE PLOTTING COLOR MAPS
The standard MCDOT black and white plot configuration files will print black for colors 0-100 and 50% screened for colors 101 and above.

COLORS
The picture below is the standard color table.
